

Chronische pancreatitis: pijn en andere complicaties

Marja Boermeester
m.a.boermeester@amc.nl

Chronische pancreatitis (CP)

Chronische progressieve ontstekingsziekte

Irreversibele veranderingen: calcificering/fibrosering

Obstructie en verlies van functie

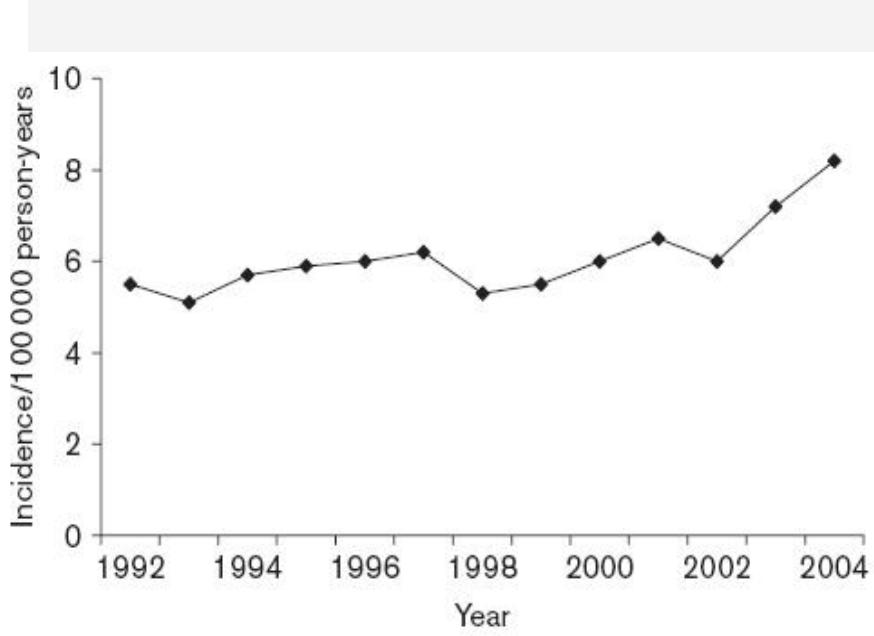

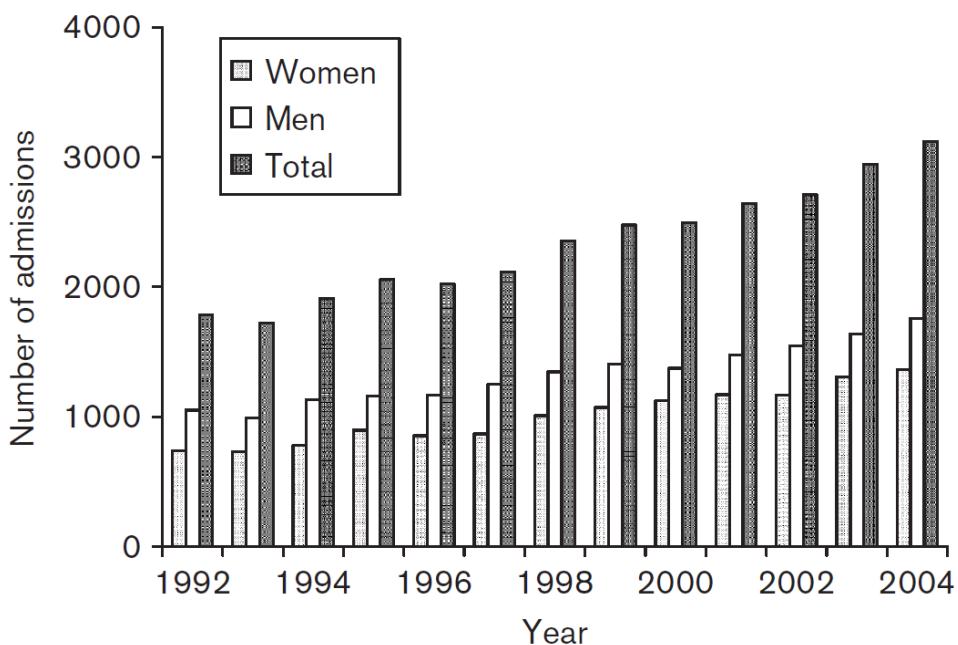

Zeer invaliderende ziekte:

Verminderde kwaliteit van leven

Beperkte (sociaal) functioneren (60%) / werkloos (37%)

Beperkte behandelingsmogelijkheden

CP – epidemiologie NL

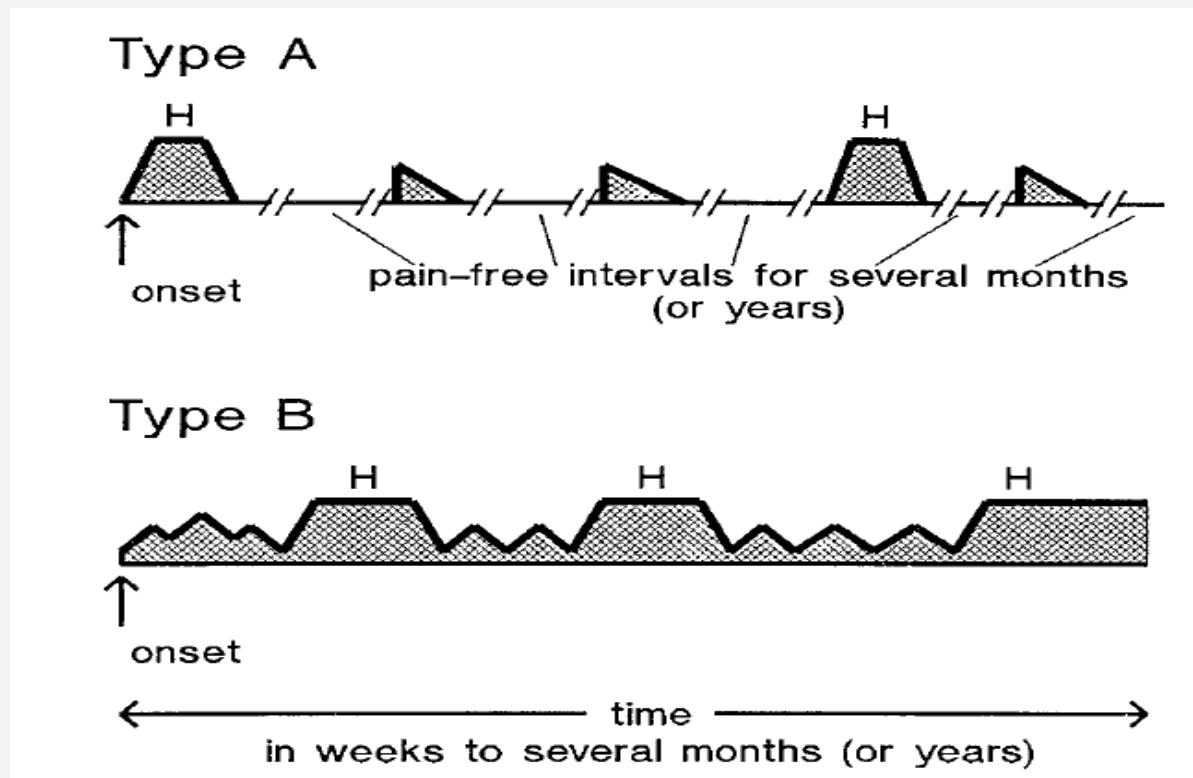

CP - etiologie

- **Alcohol:** 50%
 - Slechts 5 a 10% van alcohol misbruikers
 - Roken!
- **Idiopatisch:** 25%
 - Onbekende oorzaak
- **Obstructief:** 7%
 - Anatomisch: pancreas divisum
- **Genetische factoren:** 3%
 - Hereditaire pancreatitis
- **Zeldzame oorzaken:**
 - Autoimmuun, hyperlipidemie, hypercalcemie, Sjogren's syndroom

CP - klachten: pijn

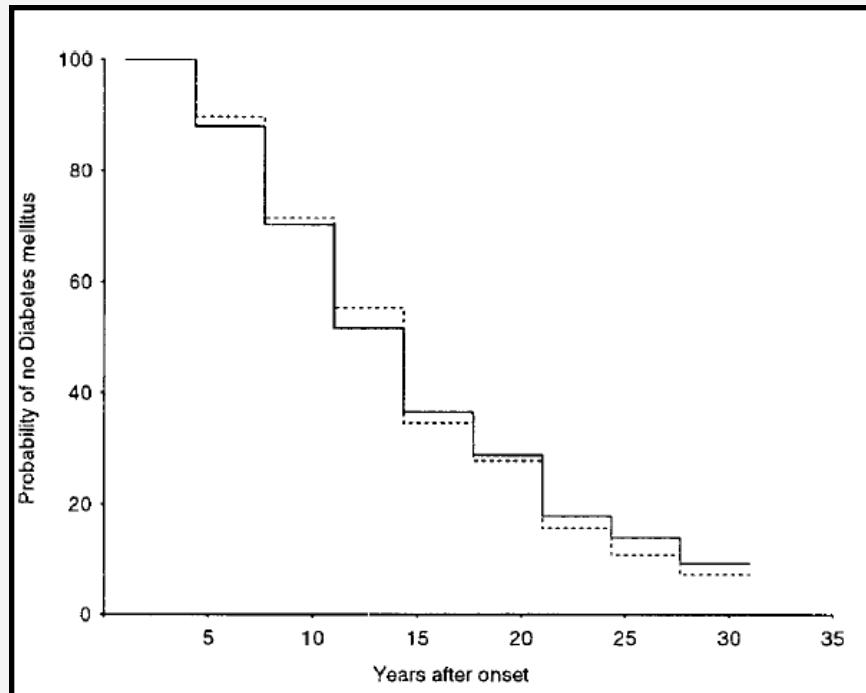

- Belangrijkste en meest beperkende symptoom
- Pijnpatroon:

CP - klachten: functieverlies

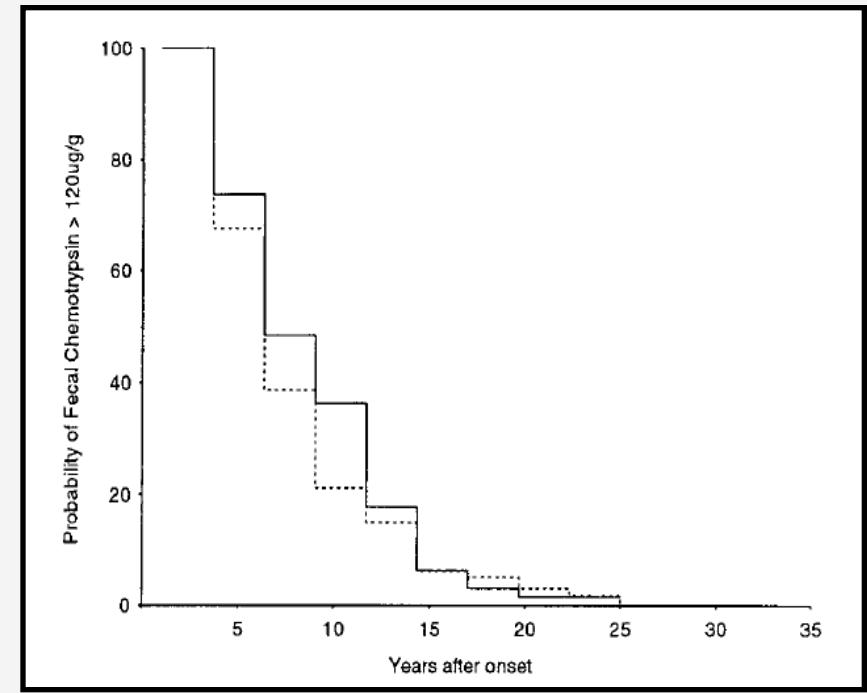

Endocriene pancreasinsufficiëntie

- 50 – 75% na 10 jaar
- diabetes mellitus

Exocriene pancreasinsufficiëntie

- 80% na 10 jaar
- gewichtsverlies/vermoeidheid/diarree/misselijkheid

Diagnostiek - beeldvorming

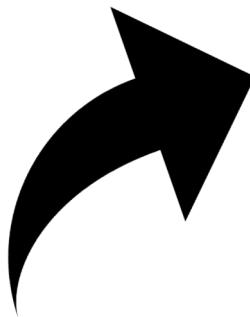

- **Sensitiviteit:** terecht positieve uitslag (%) bij CP patiënten
- **Specificiteit:** terecht negatieve uitslag (%) bij niet CP

Modality	Sensitivity	Specificity	Heterogeneity (I^2)
US	67% (95% CI: 53%>78%)	98% (95% CI: 89%>100%)	40%/93%
CT	75% (95% CI: 66%>83%)	91% (95% CI: 81%>96%)	50%/71%
MRI	78% (95% CI: 69%>85%)	96% (95% CI: 90%>98%)	59%/65%
EUS	82% (95% CI: 71%>90%)	91% (95% CI: 83%>95%)	82%/75%
ERCP	82% (95% CI: 76%>87%)	94% (95% CI: 87%>98%)	39%/67%

True pancreatic pain: Plumbing vs. wiring ?

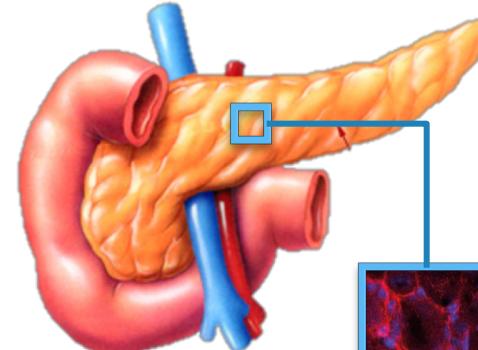

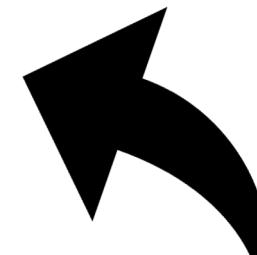

Endoscopy
or surgery

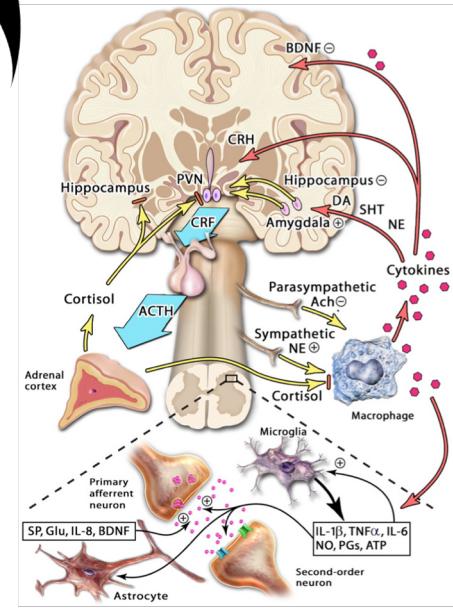

plumbing

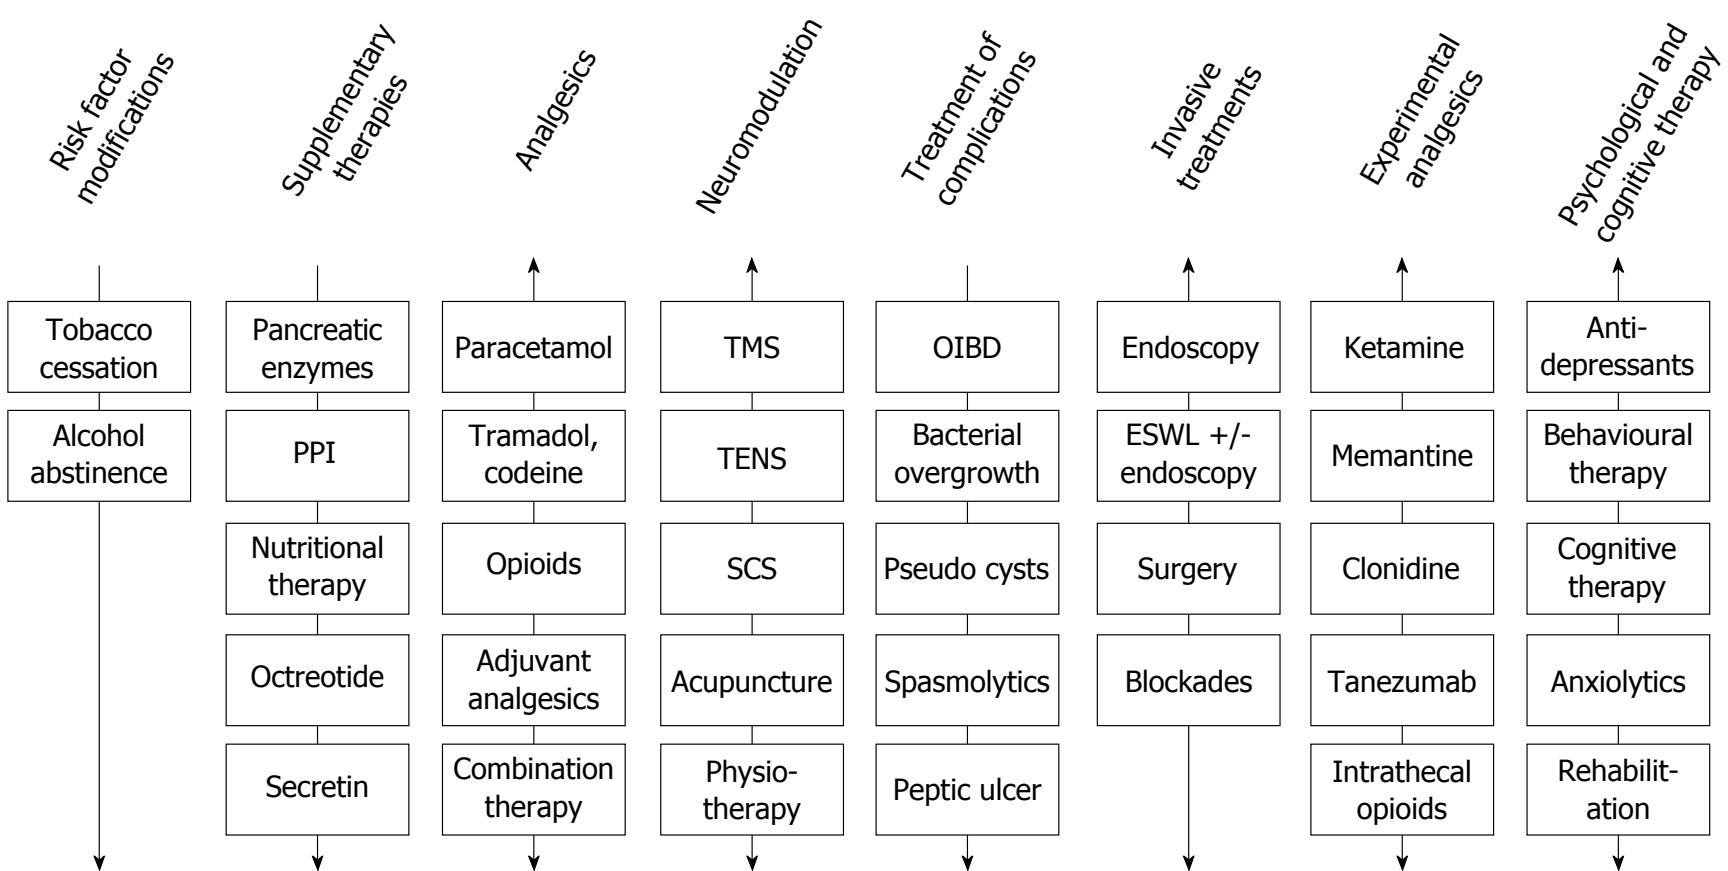

Non-invasive
treatment

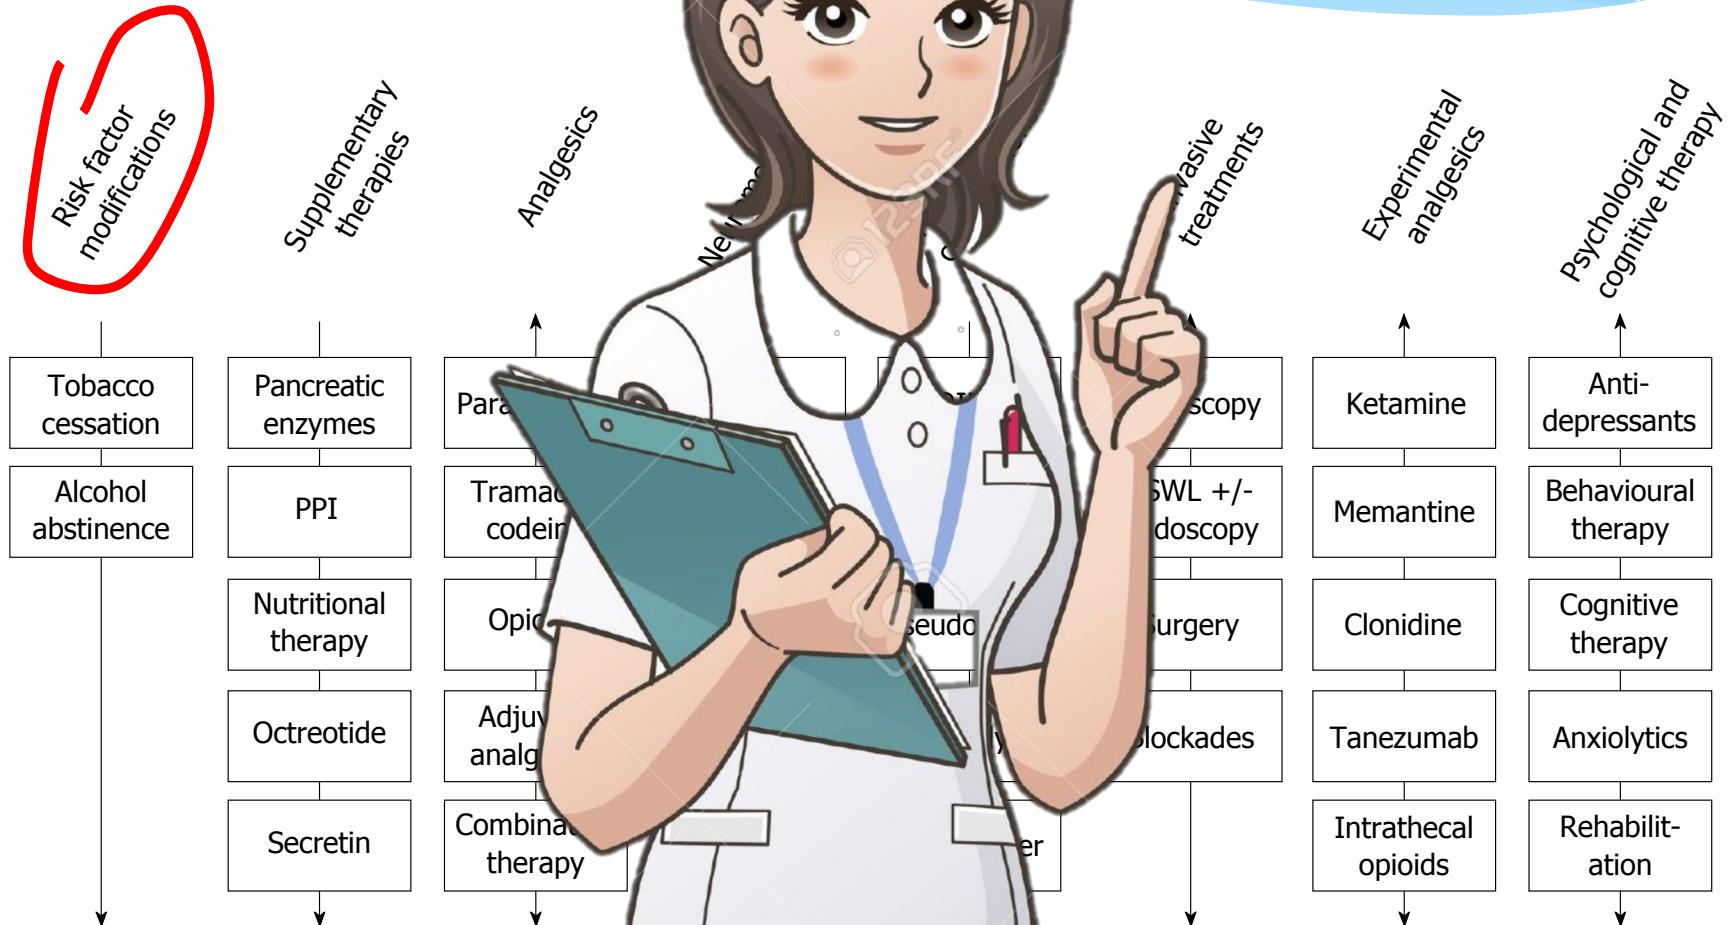

wiring

Treatment for pancreatic pain

Treatment possibilities for pancreatic pain

The effect of intervention against alcohol

120 with acute alcohol-associated pancreatitis

repeated intervention every 6 month, n=59
30 min conversation (toxic, habits, social)

initial intervention only, n=61

2 y follow-up
 $P=0.02$

n=9 with recurrent pancreatitis

n=20 with recurrent pancreatitis

The effect of intervention against smoking

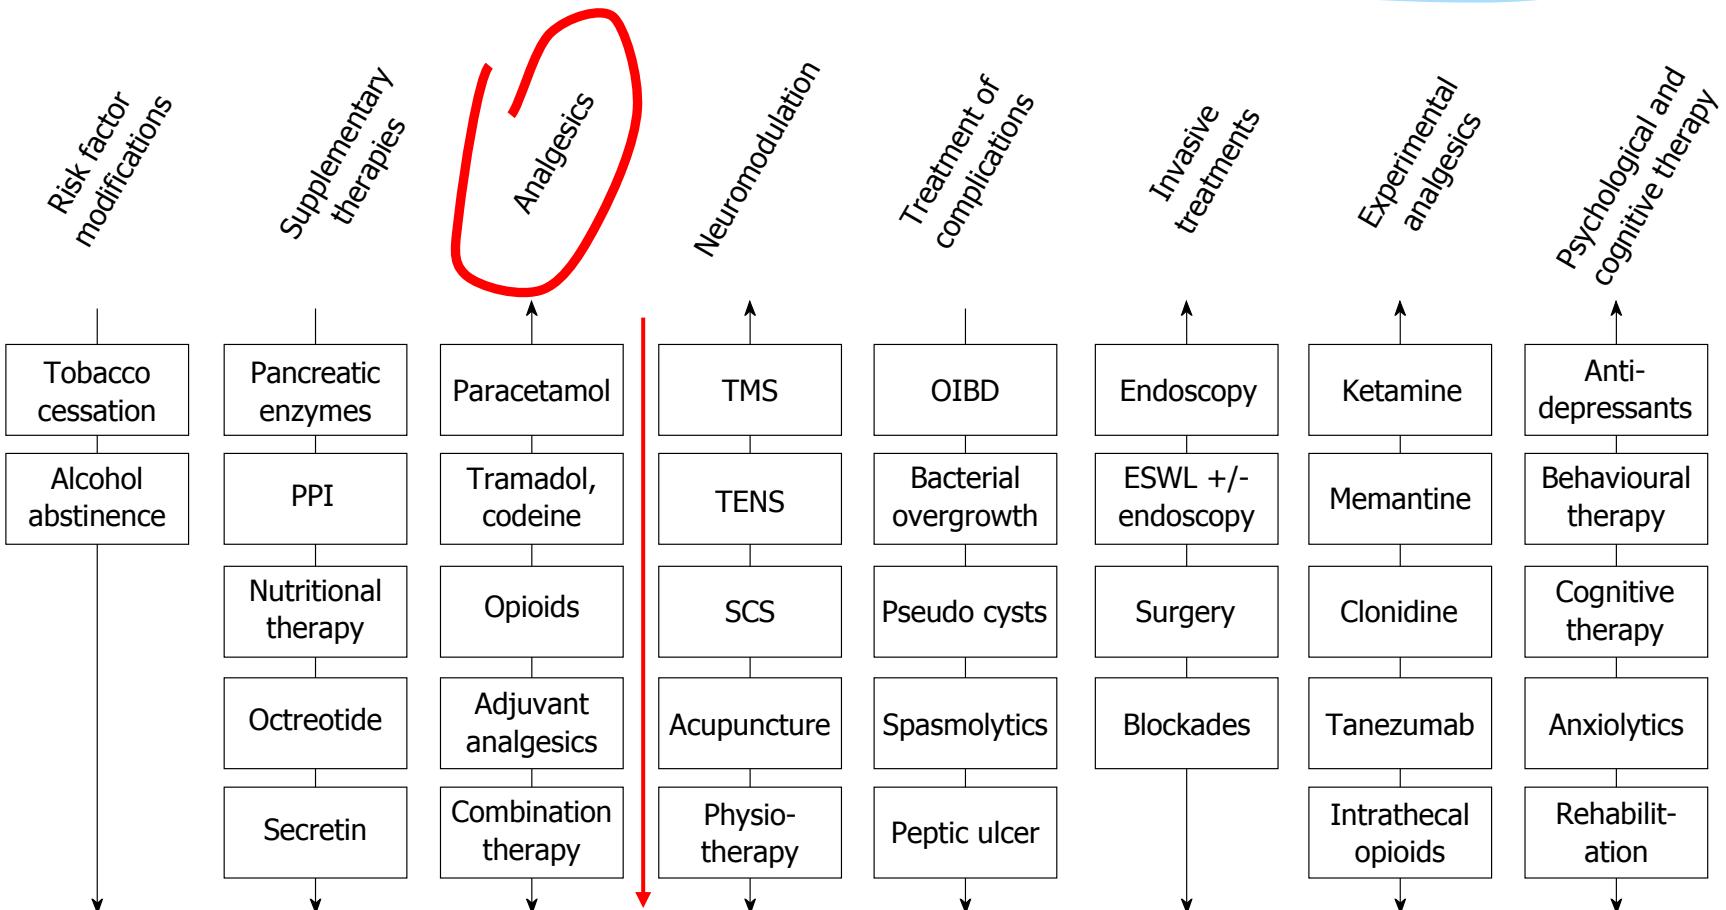

27 smokers with chronic pancreatitis and 200 smokers with other diseases

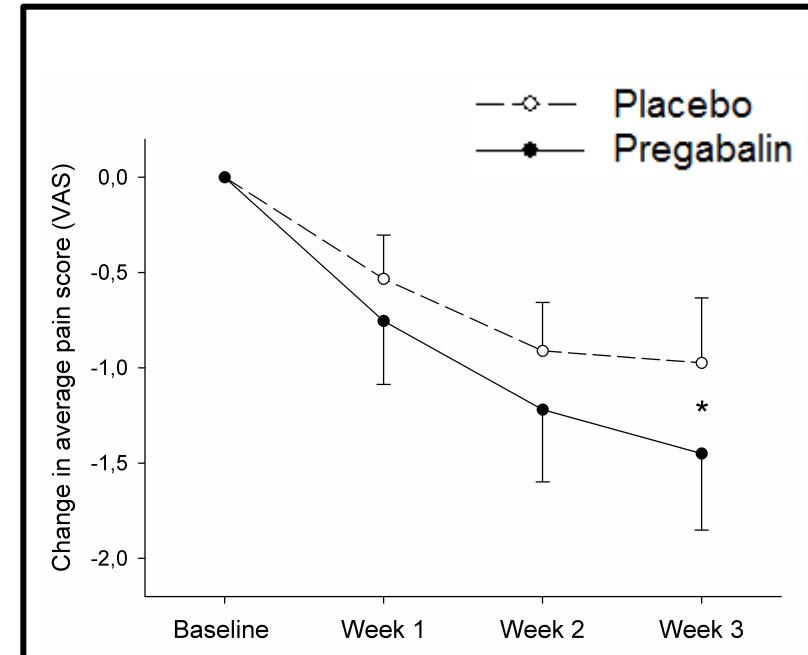

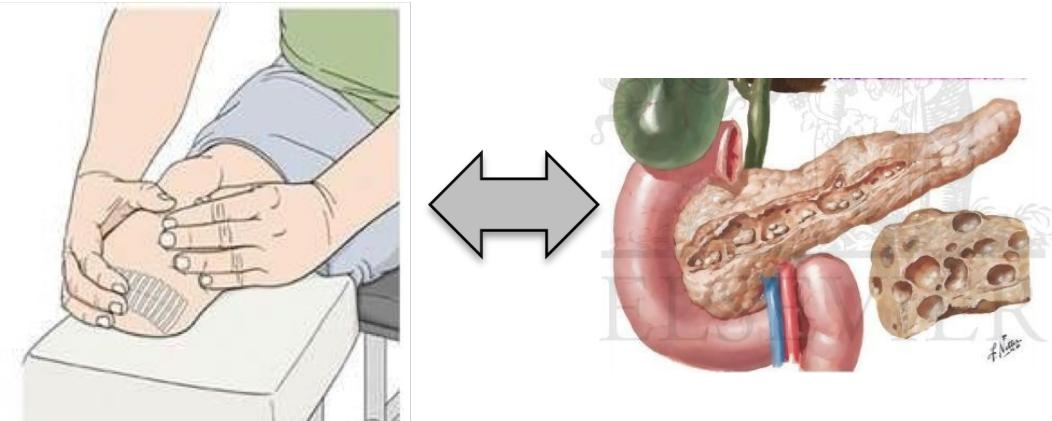

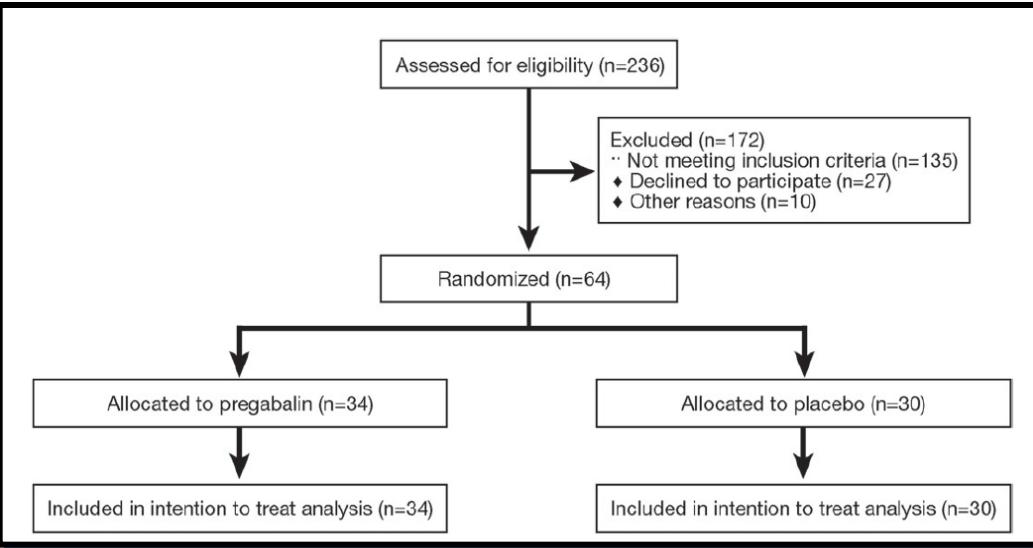

n=0 quit rate in patients
with chronic pancreatitis

n=38 (19%) quit rate
in controls

Medical treatment for pancreatic pain

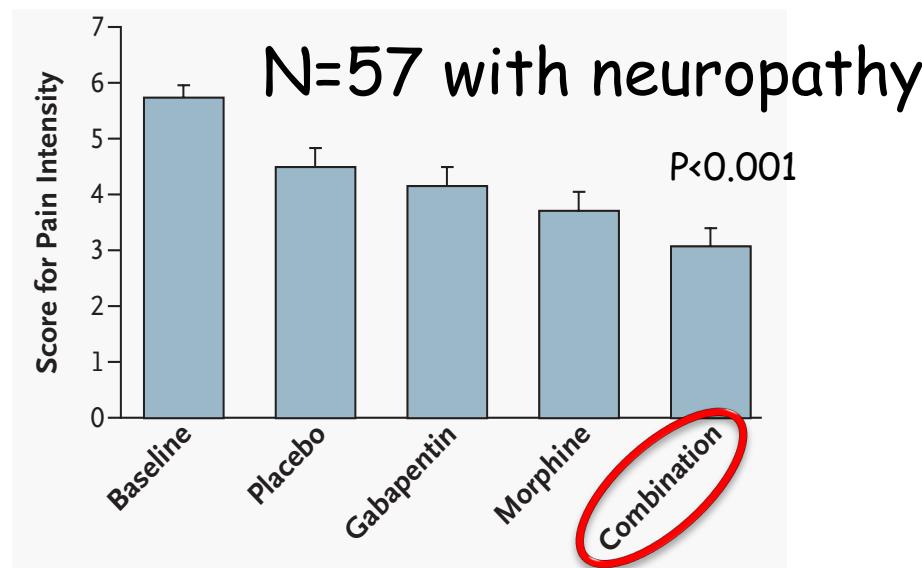

Pregabalin in chronic pancreatitis

Combination therapies

$$2+3=5$$

No GI studies exist

Gilron et al. Lancet 2009
Gilron et al. NEJM 2005
Recia et al. Med Hypotheses. 2009

Farmacologische pijnbehandeling

- Verslaving & risico's
 - polyfarmacie
 - multiple voorschrijvers
 - drug interacties
 - bijwerkingen
 - chirurgie minder effectief na langer opioid gebruik
- Beperkt effectief
 - wordt minder ineffectief
 - CP geassocieerde hyperalgesie
 - opioid geinduceerde hyperalgesie

Timing surgery vs outcome

ONLINE FIRST

Clinical Outcome in Relation to Timing of Surgery in Chronic Pancreatitis

A Nomogram to Predict Pain Relief

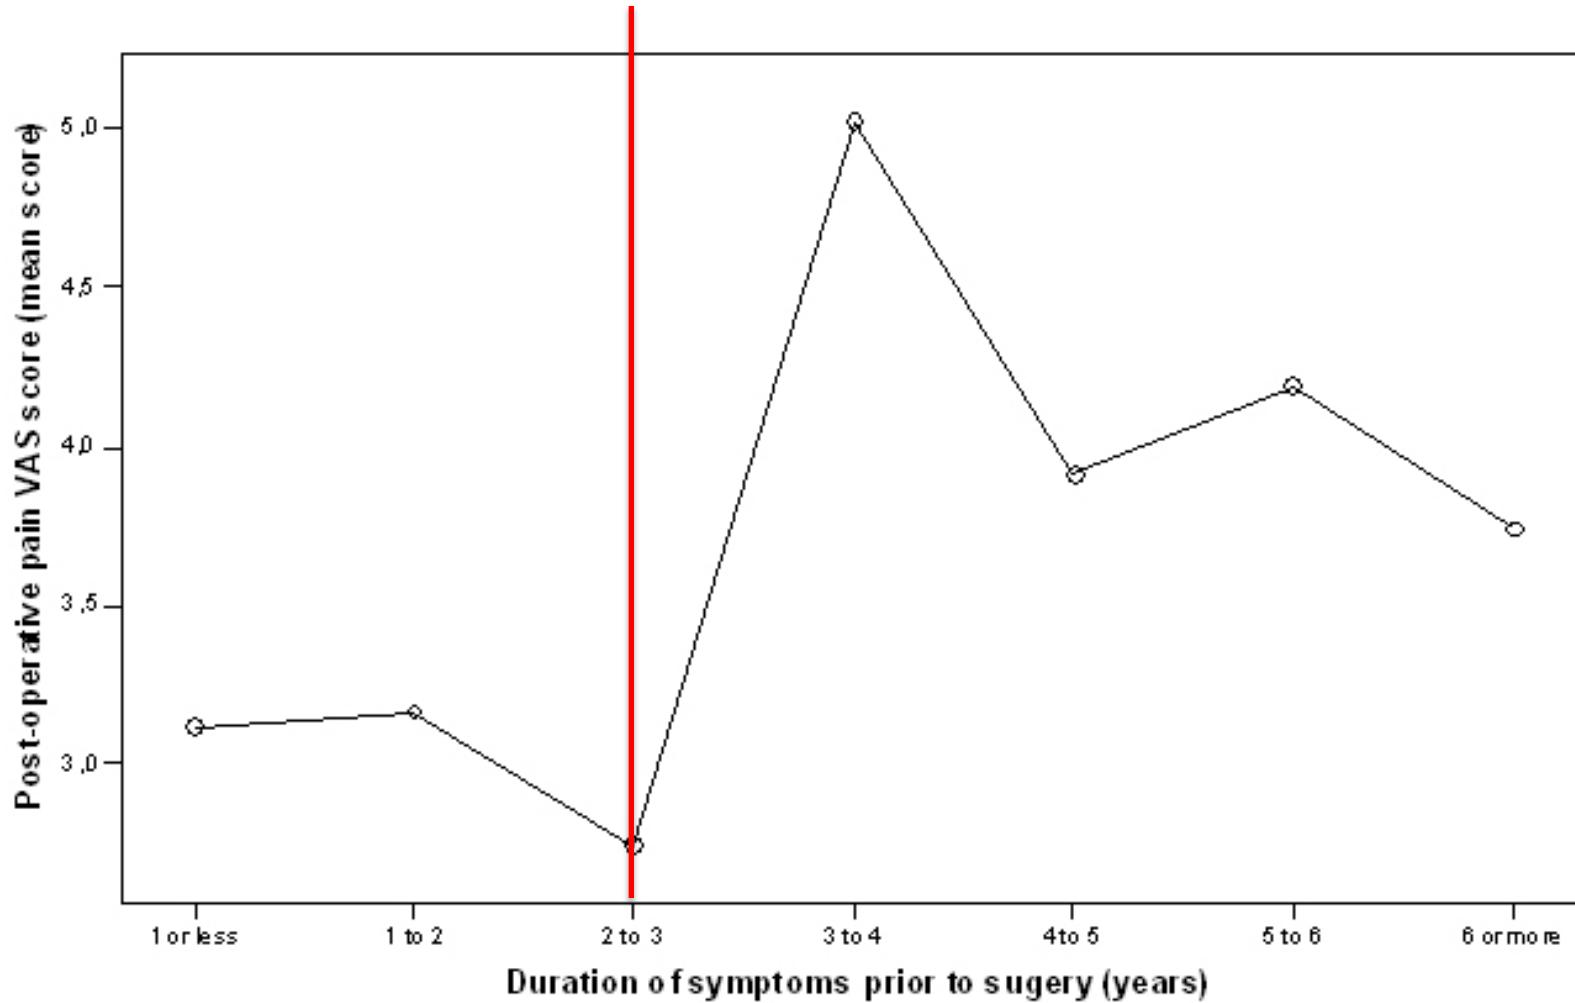

*Usama Ahmed Ali, MD; Vincent B. Nieuwenhuijs, MD, PhD; Casper H. van Eijck, MD, PhD;
Hein G. Gooszen, MD, PhD; Ronald M. van Dam, MD, PhD; Olivier R. Busch, MD, PhD;
Marcel G.W. Dijkgraaf, MD, PhD; Femke A. Mauritz, MD; Sjoerd Jens, MD; Jay Mast, MD;
Harry van Goor, MD, PhD; Marja A. Boermeester, MD, PhD; for the Dutch Pancreatitis Study Group*

Dutch DEPAN cohort – 5 centers. N = 266

Postoperative pain relief

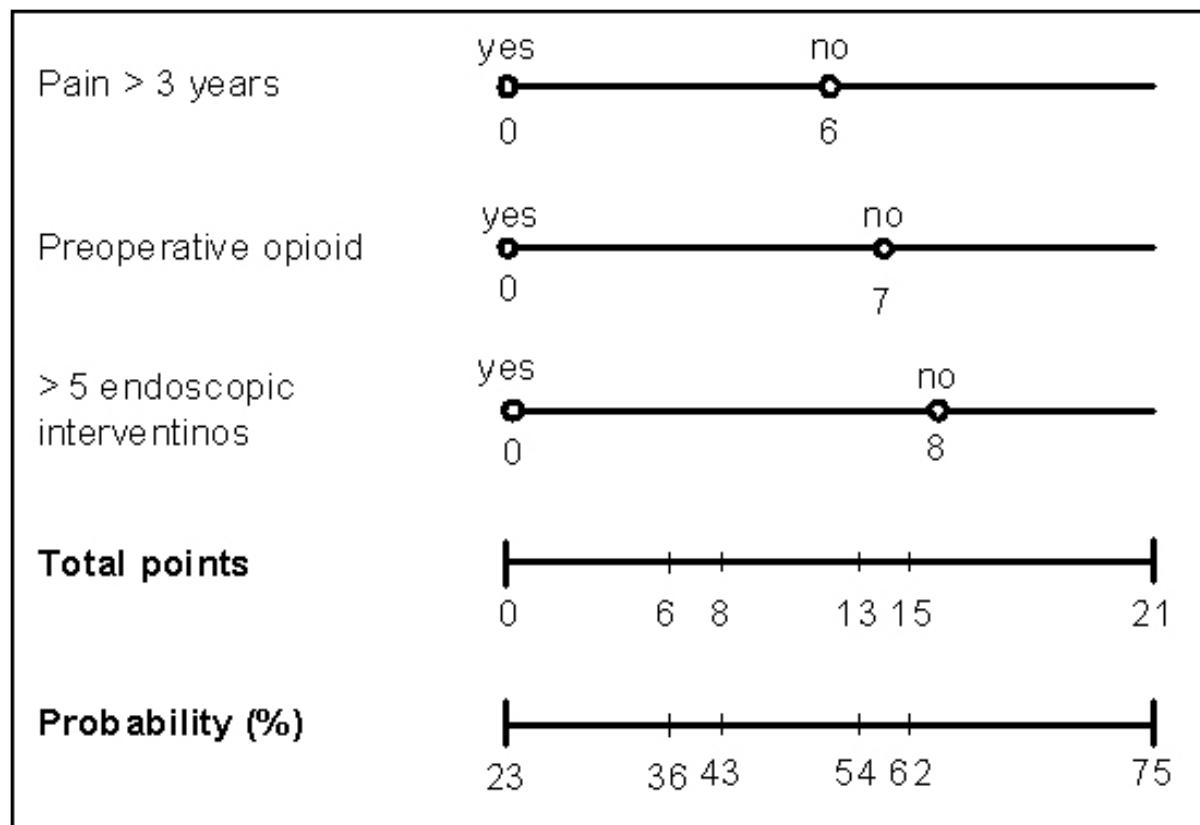

Factors in multivariate regression	OR (95% CI)	p-value
Reported duration of pain ≤ 3 years	1.81 (1.02 - 3.37)	0.032
No preoperative opioid use	2.14 (1.23 - 3.96)	0.006
Number of endoscopic treatments ≤ 5 procedures	2.46 (1.10 - 6.27)	0.039

Cut-off → duration of pain preoperative ~ post-operative pain symptoms (VAS 0-10)

Nomogram for pain relief

- Probability of pain relief varies between 23% and 75% based on timing of surgery

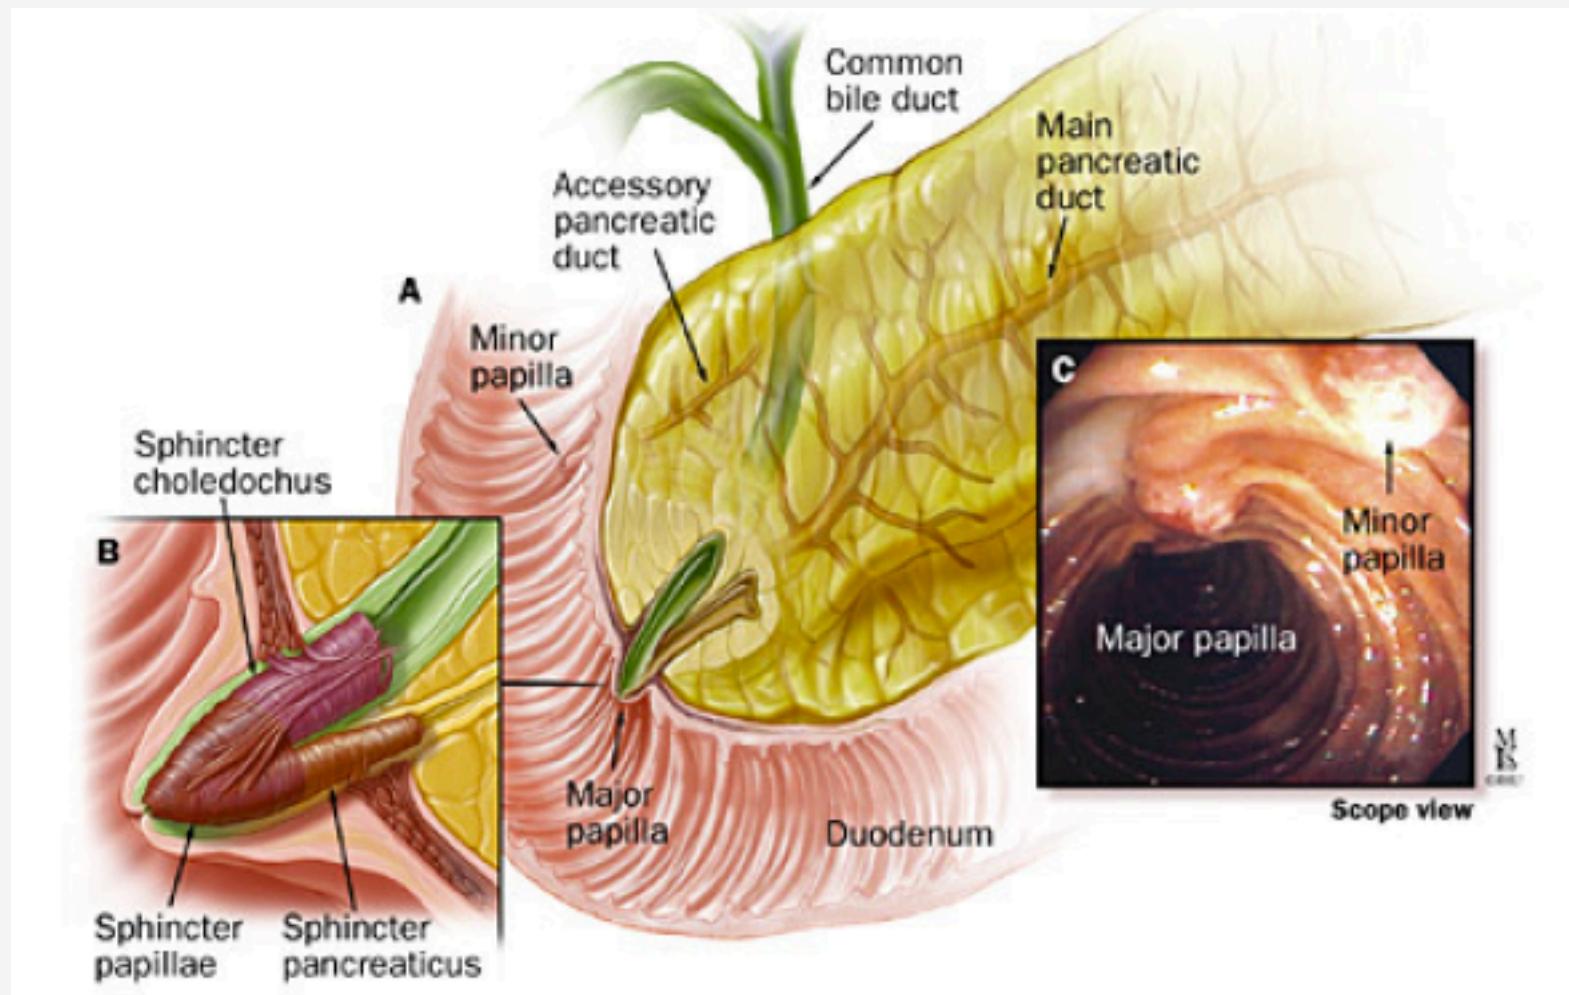

Surgical pain pathophysiology

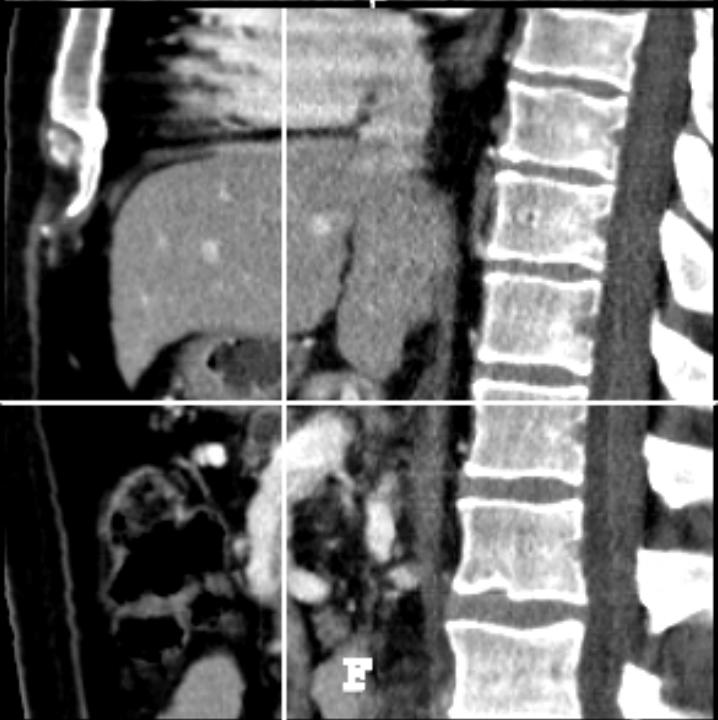

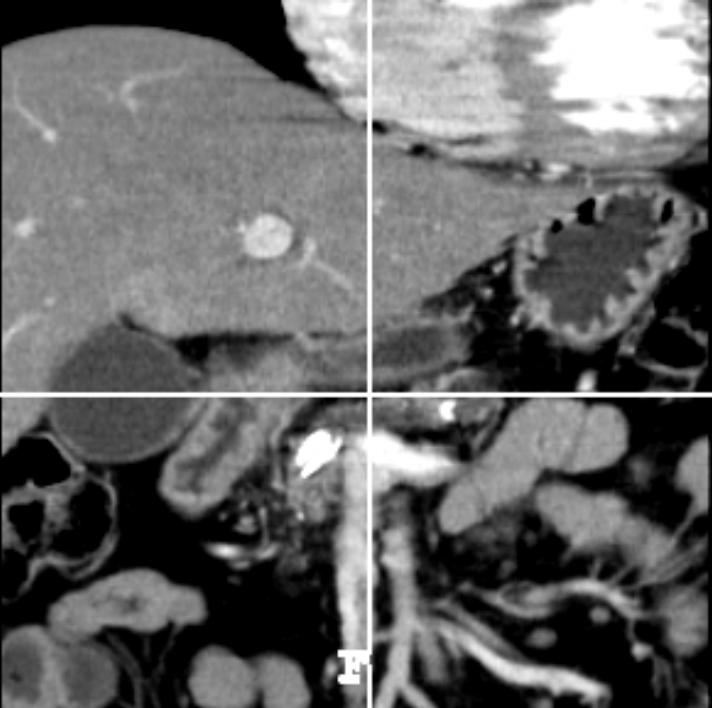

Pain in CP is caused by:

- Duct obstruction
BIG ducts (plumbing,
ductal hypertension)

Surgical pain pathophysiology

Surgical pain pathophysiology

Pain in CP is caused by:

- Duct obstruction
BIG ducts (plumbing,
ductal hypertension)
- Inflammatory ‘pacemaker’ in the head
BIG heads (wiring,
perineural)

Surgical pain pathophysiology pacemaker theory

Univariate analysis of disease factors.

	Poor pain control (n=15)	Good pain control (n=62)	p-Value
Pancreatic head size, cm (mean±SD)	4.39±0.75	5.81±1.08	p=0.001
Pancreatic duct diameter, mm	4.47±1.30	8.42±2.72	p=0.001
Volume percentage of head mass cored	48%	65%	p=0.001
Pseudocyst, number (%)	5(6.5%)	12(15.5%)	NS
Associated procedures, number (%)	3 (4%)	4 (5%)	NS

Amudhan A et al. HPB (Oxford). 2008 Dec 1; 10(6): 477–482.

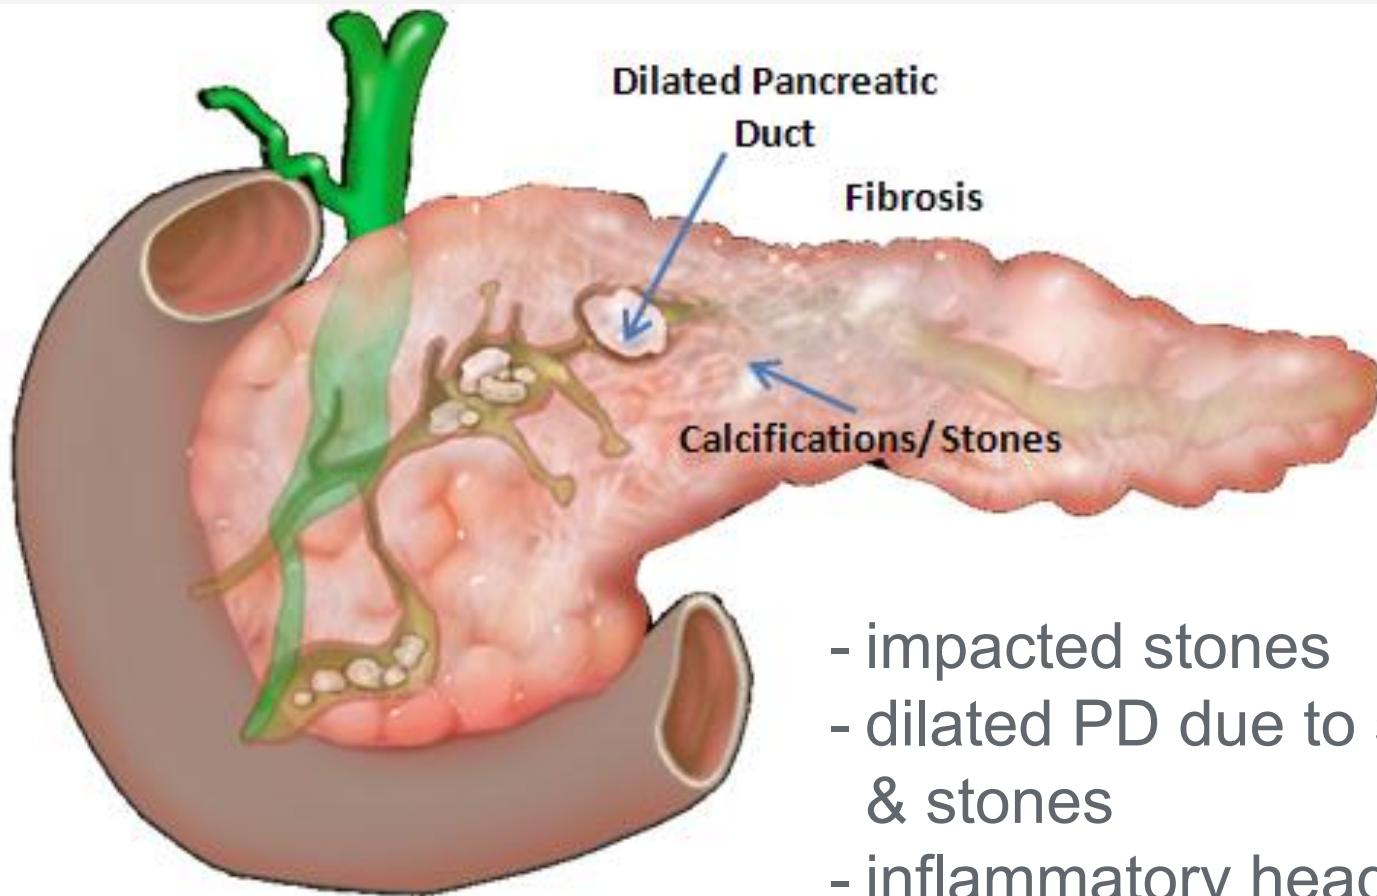

Surgical pain pathophysiology

Pain in CP is caused by:

- Duct obstruction
BIG ducts (plumbing, ductal hypertension)
- Inflammatory ‘pacemaker’ in the head
BIG heads (wiring, perineural)
- Both

Surgical pain pathophysiology

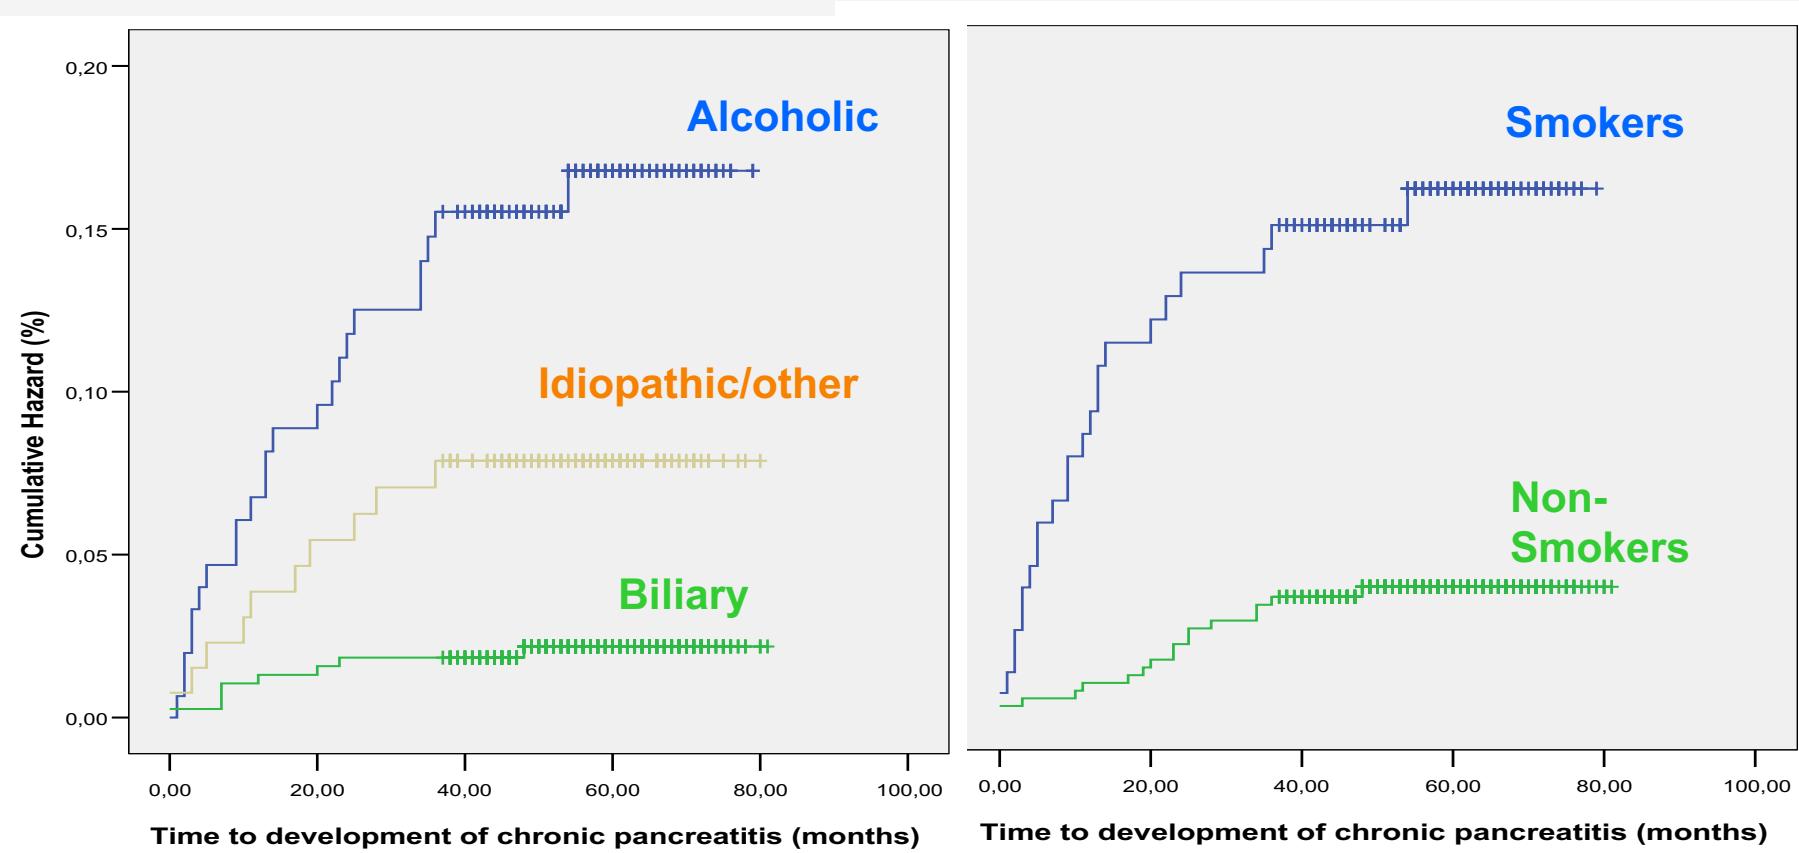

- impacted stones
- dilated PD due to strictures & stones
- inflammatory head with compression PD / CBD

Risico factor behandeling

Risico factor behandeling - van acute pancreatitis naar CP -

Alcohol, roken

Ahmed Ali U..., Boermeester MA. Clin Gastroenterol Hepatol. 2016

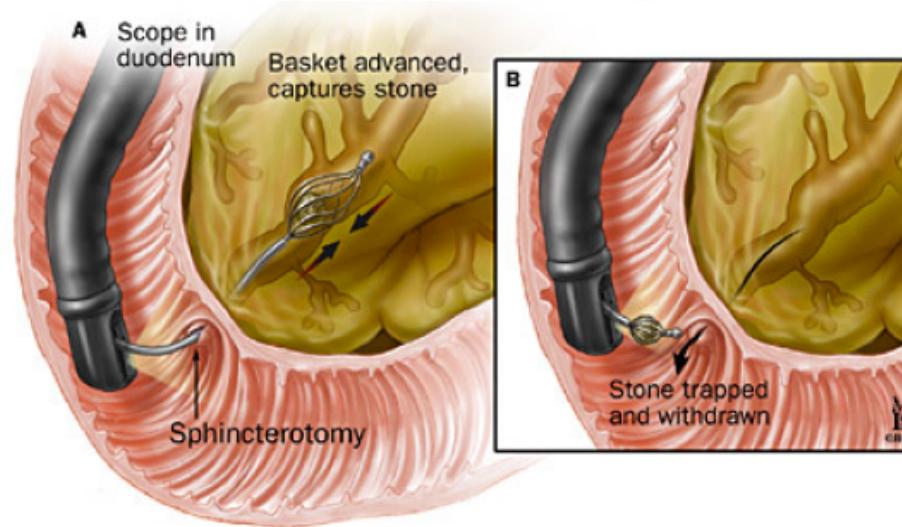

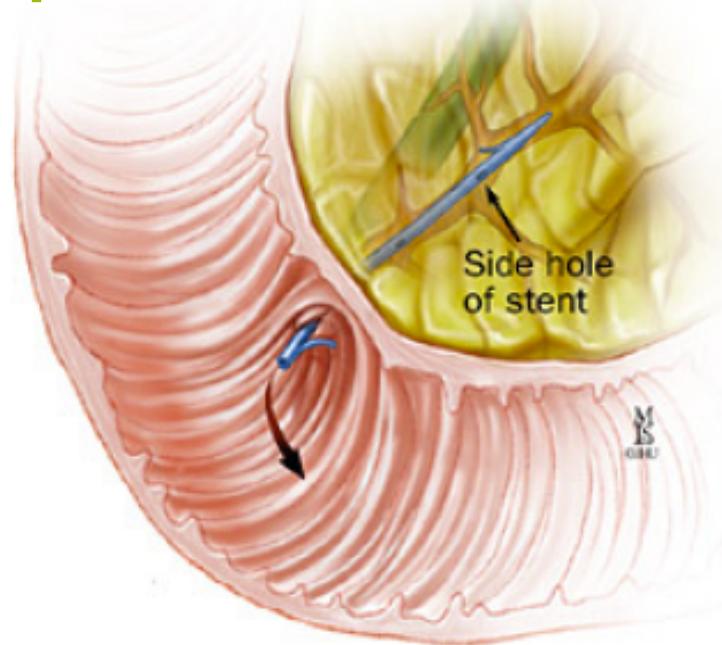

Risico factor behandeling - ? VOOR chirurgie voor CP ?

Alcohol, roken

- Er is geen goed bewijs dat stoppen met **alcohol** op zich de pijn vermindert
- Het is een illusie dat patiënten stoppen met drinken als ze veel pijn hebben
- Eis wel alcohol stop voordat tot operatie over te gaan
- **Roken** is geassocieerd met het drinken
- Het is een illusie dat patiënten stoppen met roken als het ze eenmaal gelukt is om te stoppen met drinken

Endoscopic pain treatment

PD stenting

Endoscopic pain treatment - series

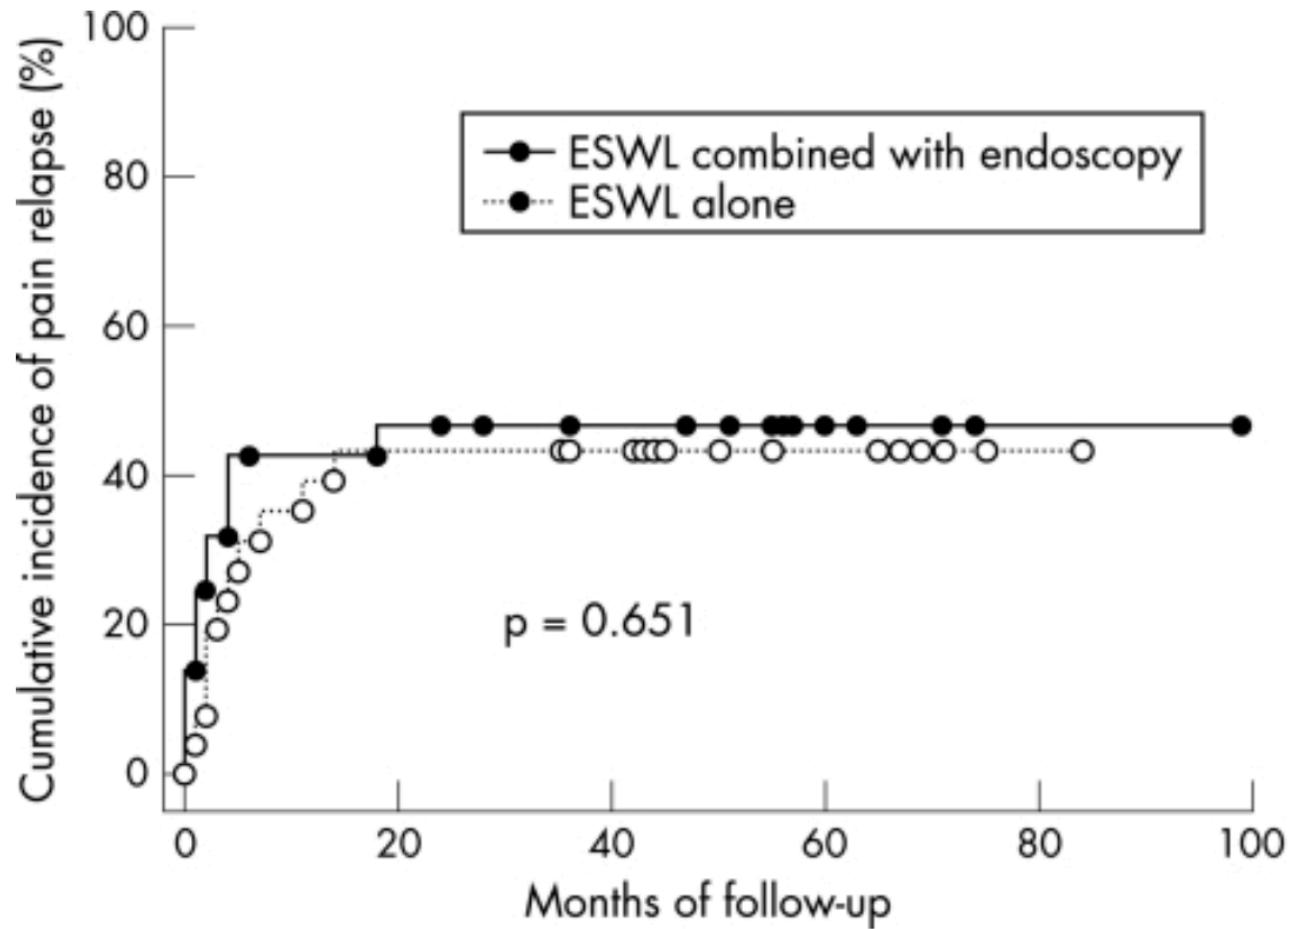

Table 1. Results of endoscopy and ESWL for pancreatic stones in series of >20 patients

First author	Year	Patients n	Mean follow-up months	Complete or partial pain relief %	Overall morbidity %	Late mortality %	Need for surgery %	Exocrine/endocrine function improved %	ESWL %	Fragmentation %	Complete clearance %
Delhaye [35]	1992	123	14	85	23	1.7	8	55/10	99	99	59

2–4	0.91 [0.33–2.53]	2.19 [0.59–8.14]
≥5	1.41 [0.47–4.24]	3.89 [1.01–14.9]**

N=223

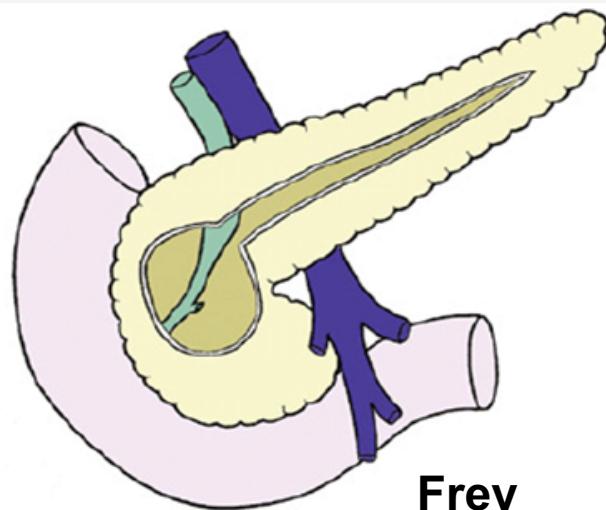

Surgical pain treatment

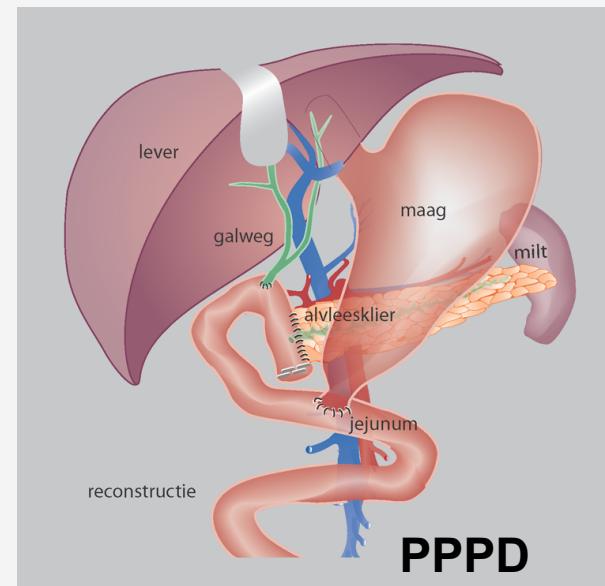

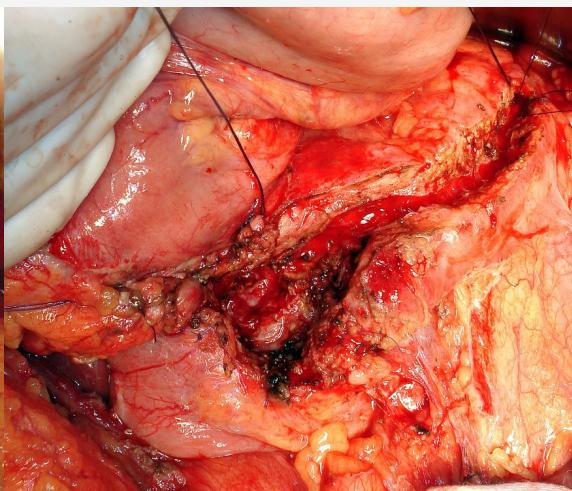

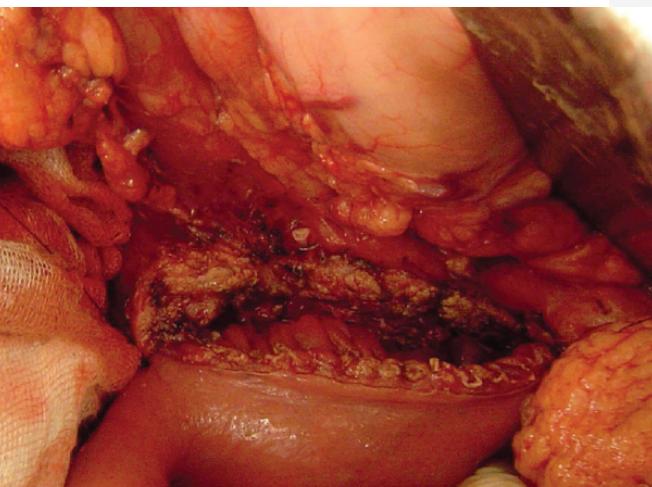

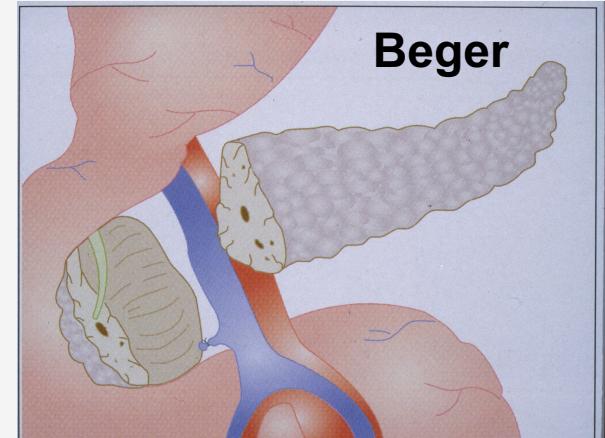

Practice variation drainage only vs. resection

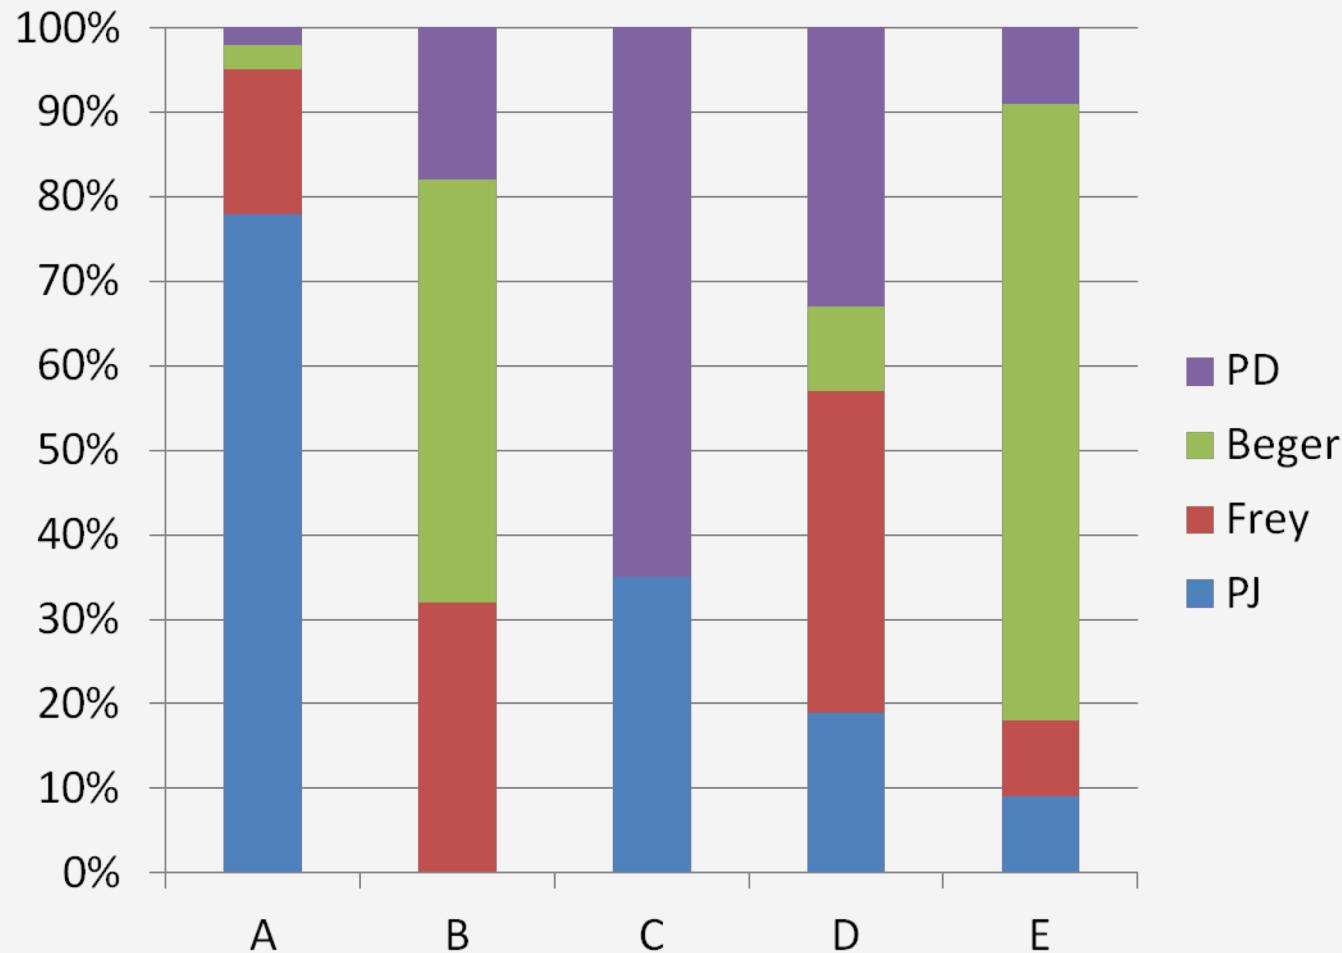

PJ

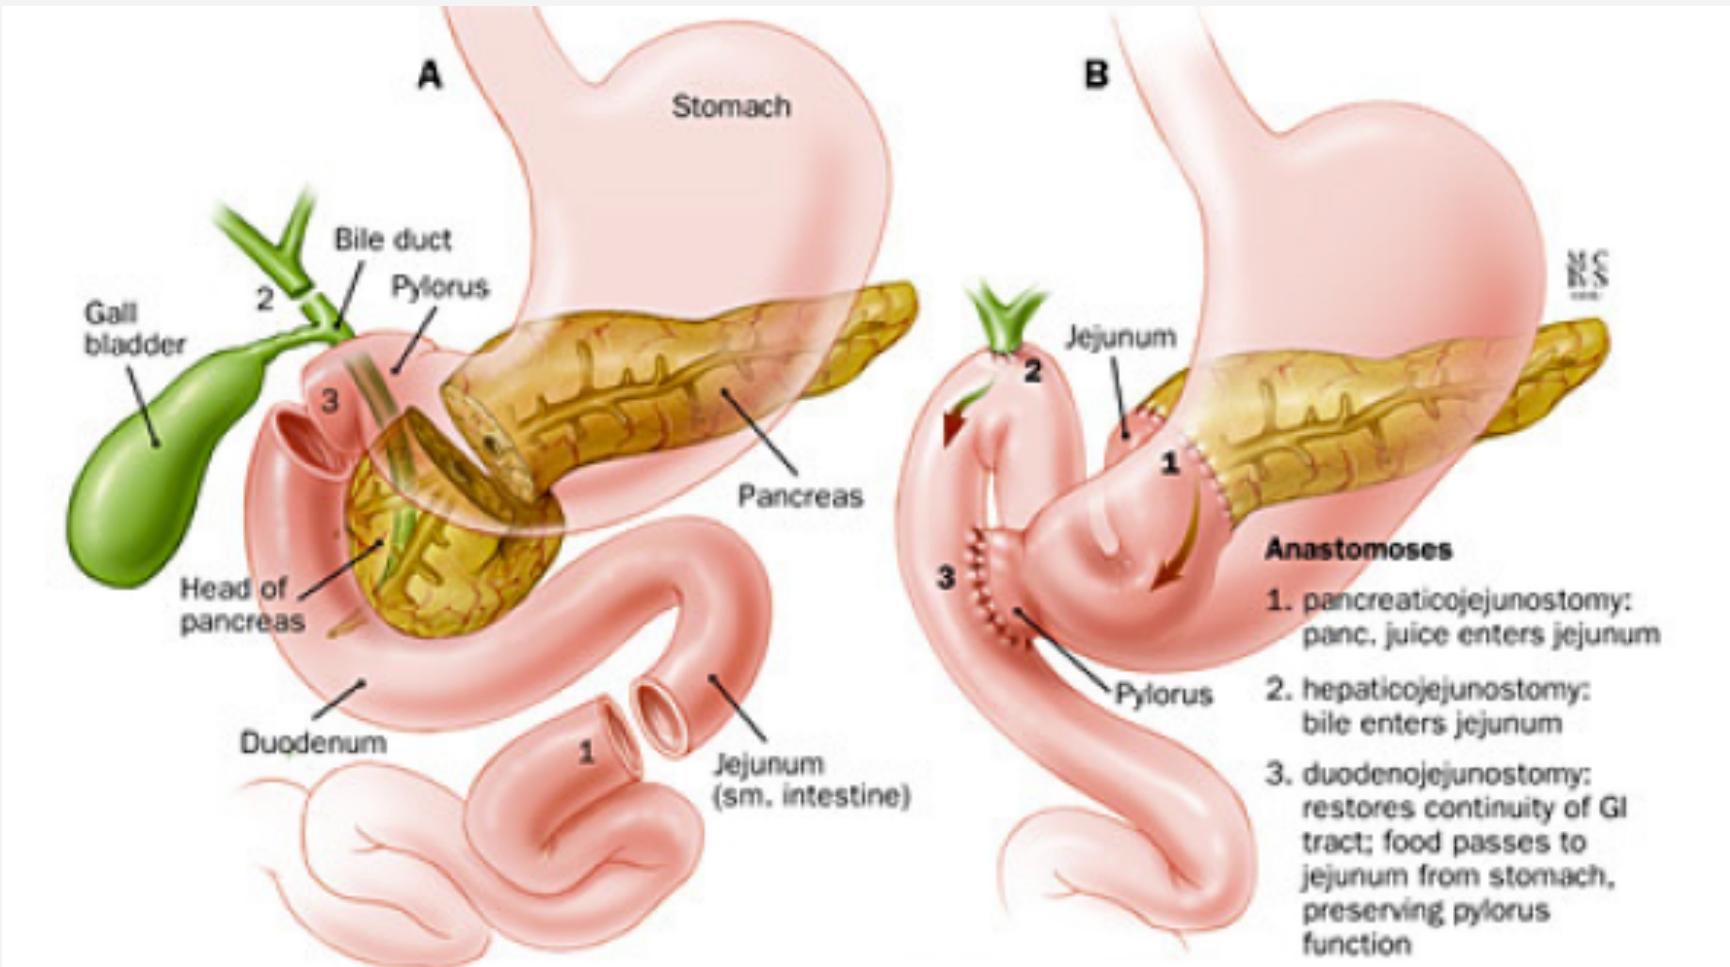

Frey

Practice variance of surgery for CP in The Netherlands

? Major resection not drainage only ? – PPPD (PP Whipple)

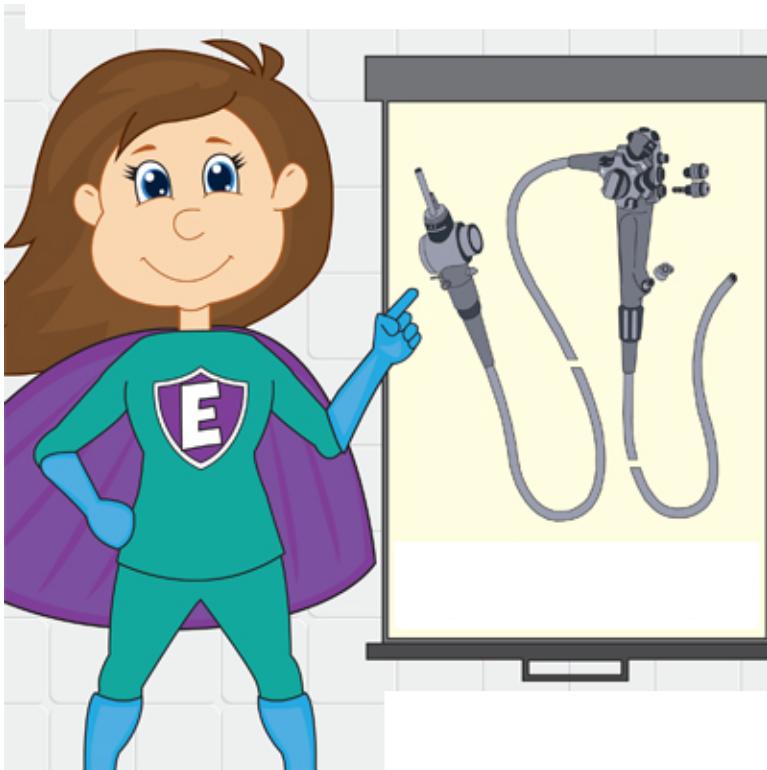

? Why major resection when drainage only suffices ?

TABLE 3: Randomized controlled studies on the surgical treatment of painful CP.

Authors	Publication	Number of patients	Results
Izbicki et al.	Ann. Surg. 1995 [33]	42	Frey equal to Beger
Izbicki et al.	Chirurg 1997 [37]	74	Frey equal to Beger
Strate et al.	Ann. Surg. 2005 [34]	74	Frey equal to Beger
Klempa et al.	Chirurg 1995 [27]	43	Beger better than Whipple
Büchler et al.	Am. J. Surg. 1995 [13]	40	Beger better than Whipple
Köninger et al.	Surgery 2008 [35]	65	Berne/Farkas better than Beger
Izbicki et al.	Ann. Surg. 1998 [30]	61	Frey better than Whipple
Farkas et al.	Langenbecks Arch Surg. 2006 [29]	40	Frey better than Whipple
Bachmann et al.	Ann. Surg. 2013 [31]	64	Frey better than Whipple

Hartmann D, Friess H. Gastroenterol Res Pract. 2015

VS.

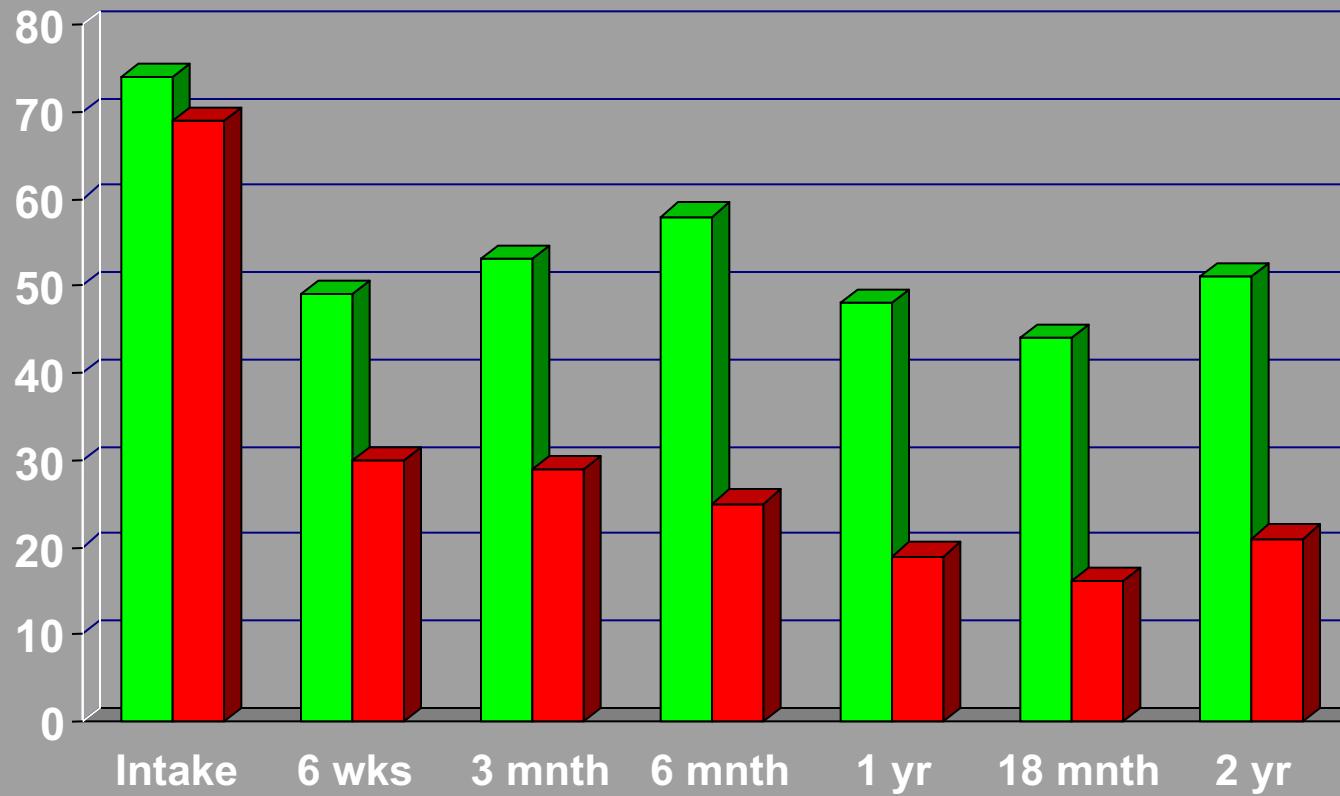

Endoscopy vs. Surgery

ESWL + Endoscopic drainage	Partington-Rochelle	Complications and pancreatic function	Pain relief Follow-up 1
N=19 (18/19 ESWL)	N=20	No differences	2 years: 32% vs. 75%

Cahen DL et al – NEJM 2007

Endoscopic drainage vs surgery: Izbicki pain score

- Endoscopy (mean Izbicki score 51)
- Surgery (mean Izbicki score 25; $p < 0.001$)

Morbidity / mortality

	morbidity	mortality
surgery (AMC cohort)	22 %	0.9 %
surgery (CEPAN)	35%	0 %
endoscopy (CEPAN)	53 %	5.3 %

CEPAN: Cahen et al – NEJM 2007

AMC cohort: Van der Gaag et al – Ann Surg 2012

Endoscopy vs. Surgery (2)

ESWL + Endoscopic drainage	Partington-Rochelle	Complications and pancreatic function	Pain relief Follow-up 1	Pain relief Follow-up 2
N=19 (18/19 ESWL)	N=20	No differences	2 years: 32% vs. 75%	5 years: 38% vs. 80%

- Long term follow-up in the endoscopy group:
47% needed surgery after endoscopy

Cahen DL et al – NEJM 2007
Cahen DL et al – Gastroenterology 2011

Endoscopic or surgical intervention for painful obstructive chronic pancreatitis

Cochrane review 2012

Usama Ahmed Ali¹, Johanna M Pahlplatz¹, William H Nealon², Harry van Goor³, Hein G Gooszen⁴, Marja A Boermeester⁵

SUMMARY OF FINDINGS FOR THE MAIN COMPARISON [\[Explanation\]](#)

Endoscopy compared to surgery for painful obstructive chronic pancreatitis

Patient or population: patients with painful obstructive chronic pancreatitis

Settings:

Intervention: surgery

Comparison: endoscopy

Outcomes	Illustrative comparative risks* (95% CI)		Relative effect (95% CI)	No of Participants (studies)	Quality of the evidence (GRADE)
	Assumed risk	Corresponding risk			
	Endoscopy	Surgery			
Pain relief Follow-up: 2-3 years	509 per 1000	825 per 1000 (621 to 1000)	RR 1.62 (1.22 to 2.15)	111 (2 studies)	⊕⊕⊕○ moderate¹
Major complications	See comment	See comment	Not estimable	179 (2 studies)	⊕⊕○○ low^{2,3}

Treatment for CP

Surgery in CP (WP 5)

Q4-1.1: In patients with symptoms of CP, should endoscopy or surgery be performed?

Statement 4-1.1. Surgery is superior to endoscopy in terms of mid-term and long-term pain relief in patients with painful CP. (**GRADE 2B, agreement**)

Q4-1.2: What is the optimal timing for surgical therapy in CP?

Statement 4-1.2a. To achieve optimal long-term pain relief in patients suffering from CP, early surgery is favoured over surgery at a more advanced stage of the disease.²⁵¹ (**GRADE 2B, weak agreement**)

Statement 4-1.2b. The risk of developing PEI is lower after early surgery for CP than after surgery performed at an advanced disease stage. Pancreatic resection techniques have a higher risk of PEI than drainage techniques. (**GRADE 2C, weak agreement**)

Early Surgery versus Optimal Current Step-up Practice for Chronic Pancreatitis

ESCAPE trial
randomised multicenter trial

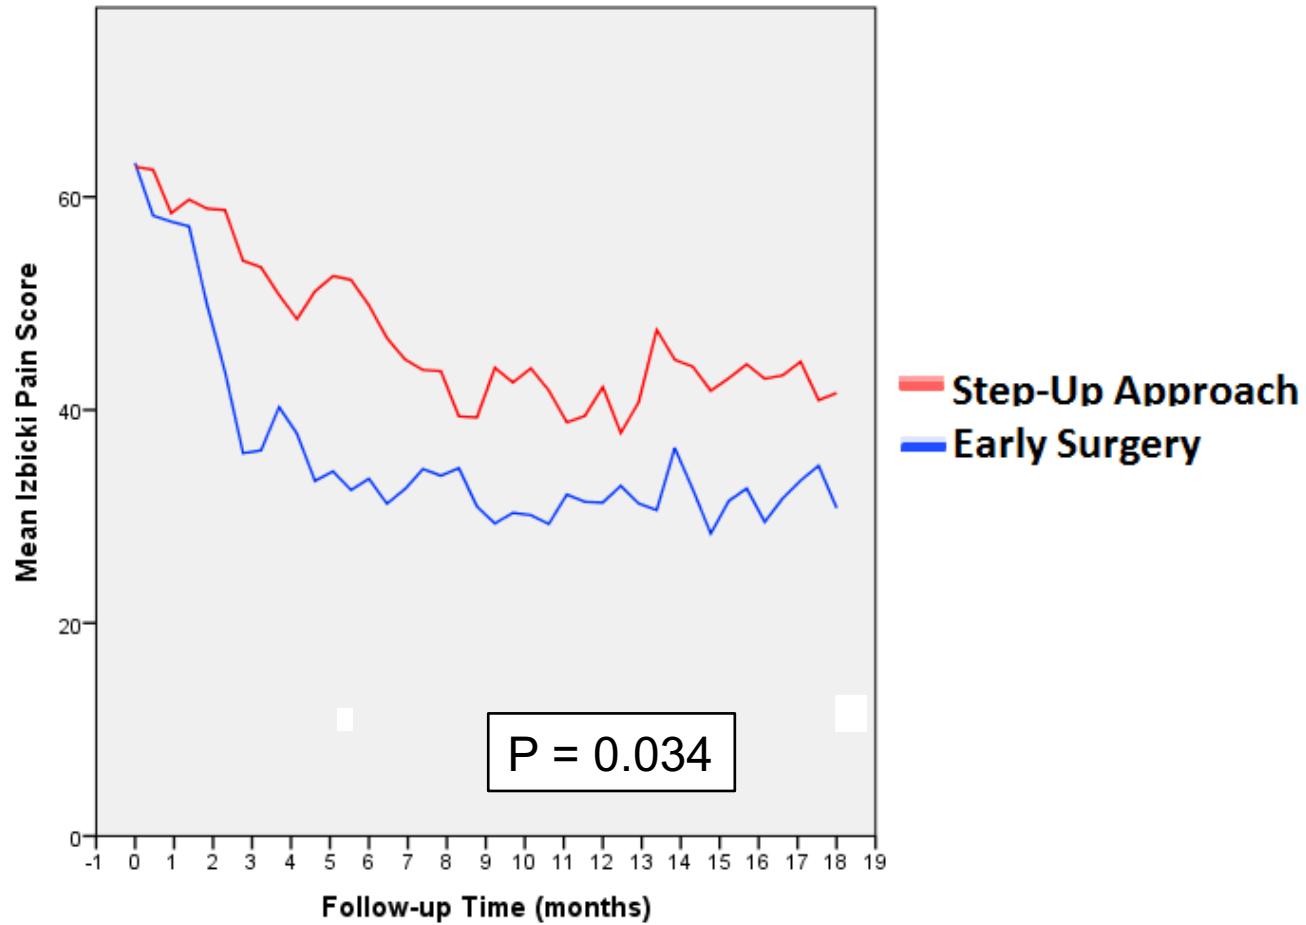

Protocol RCT: Ahmed Ali U,.., Boermeester MA. BMC Gastroenterol. 2013

ESCAPE trial: PICO

- *Patients:* 88 patients with chronic pancreatitis (PD > 5 mm), opioids < 2months
- *Intervention:* Surgery: pancreateojejunostomy or Frey
- *Comparison:* Surgical step-up approach: 1) opioids, 2) endoscopy, 3) surgery)
- *Outcome:* Izbicki pain questionnaire, every 2 wks weeks during follow-up of 18 month

20 Dutch hospitals, 2011-2014

Take home messages

Elke patiënt met pijnlijke chronische pancreatitis moet worden besproken tijdens **een MDO met een gastroenteroloog en chirurg, beiden ervaren in CP interventies**

‘Tailor your approach’

- leeftijd, co-morbiditeit, wens van de patiënt
- steen grootte, steen locatie, aantal stenen, stenen in/buiten de PD
- stricturen PD
- grootte pancreaskop
- eerdere interventies

Besluit vooraf de maximale tijd voor effect endoscopie, ideaal max 6-8 weken
